

Digital Transformation for Public Documents

HPD has the potential to leverage digital technology platforms, including QR codes, to enhance accessibility for individuals with visual impairments. This initiative will streamline the process of public document completion by providing audio descriptions of the document's contents, which can be accessed by scanning the QR codes with a smartphone or other compatible devices.

To refine this strategy, the following steps are proposed:

- Establish a uniform format for QR codes that encapsulates key details about the document, such as the title, author, and publication date.
- Construct a comprehensive database of audio recordings that can be retrieved by scanning the corresponding QR code. This will ensure that essential information is readily available in an accessible format.

This approach underscores our commitment to inclusivity and efficiency in our operations.
